Received December 03, 2018; Revised January 07, 2019; Accepted January 18, 2019

Abstract We derive an explicit matrix representation for the Hamiltonian of the Ising model in mutually orthogonal external magnetic fields, using as basis the eigenstates of a system of non-interacting spin 1/2 particles in external magnetic fields. We subsequently apply our results to obtain an analytical expression for the ground state energy per spin, to the fourth order in the exchange integral, for the Ising model in perpendicular external fields.

Keywords: ising model, quantum fluctuations, is non-degenerate, non-degenerate rayleigh-schrödinger perturbation theory

1. Introduction

Field-induced effects in low-dimensional quantum spin systems have been studied for a long time [1,2]. Hamiltonian models incorporating external magnetic fields are gaining popularity among experimentalists as well as theoreticians (see references [3,4,5,6]). A longitudinal field is often introduced mainly to facilitate the calculation of order parameter and associated susceptibility as can be seen for example in references [7,8,9], and a transverse field to introduce quantum fluctuations [10,11].

Our main objective in this paper is to give an explicit matrix representation for the Hamiltonian of a system of \( N \) spin-1/2 particles on a cyclic one dimensional lattice chain, interacting via nearest neighbour exchange, in the presence of transverse and longitudinal external magnetic fields.

The Hamiltonian \( H \), is

\[
H = -h_x \sum_{i=1}^{N} S_i^x - h_y \sum_{i=1}^{N} S_i^y - h_z \sum_{i=1}^{N} S_i^z - J \sum_{i=1}^{N} S_i^z S_{i+1}^z, \tag{1}
\]

where \( h_x \) and \( h_y \) are the uniform transverse magnetic fields, \( h_z \) is the uniform longitudinal field, \( J \) is the nearest neighbour exchange interaction, \( S_i \) are the usual spin-1/2 operators and the fields \( h_x \), \( h_y \) and \( h_z \) are measured in units where the splitting factor and Bohr magneton are equal to unity. Periodic boundary condition is assumed so that \( S_{N+i}^z = S_i^z \), and so on. The parameters \( h_x \), \( h_y \), \( h_z \) and \( J \) are all assumed to be non-negative.

It is convenient to write \( H = H_F + H_I \), where

\[ H_I = -J \sum_{i=1}^{N} S_i^z S_{i+1}^z \]

and

\[ H_F = -h_x \sum_{i=1}^{N} S_i^x - h_y \sum_{i=1}^{N} S_i^y - h_z \sum_{i=1}^{N} S_i^z. \]

\( H_F \) describes a system of \( N \) non-interacting spin 1/2 particles in mutually orthogonal external magnetic fields.

The model (1) has been widely studied for various combinations of the parameters \( h_x \), \( h_y \), \( h_z \) and \( J \), especially for phase transitions (see [3,5,12] and the references therein). Our aim is to give an explicit matrix representation for \( H \), using the eigenstates of \( H_F \) as basis.

Throughout this paper we will make use of the following identities which hold for \( j, k \in \{0,1\} \):

\[ j = \sin^2(j \pi / 2), \quad 1 - j = \cos^2(j \pi / 2), \]

\[ \delta_{jk} = 1 - j - k + 2 j k = \cos^2\{(j - k)\pi / 2\}, \]

\[ j + k - 2 j k = \sin^2\{(j - k)\pi / 2\}, \]

\[ (-1)^j \delta_{jk} = 1 - j - k = \delta_{jk} - 2 j k = \cos\{(j + k)\pi / 2\}. \]
in particular \((-1)^j = 1 - 2j = \cos j\pi, \quad (-1)^j = 2j - 1,\)
\((-1)^j + (-1)^k = 2(-1)^j \delta_{jk},\)
\((-1)^{j+k} = 2\delta_{jk} - 1 = \cos((j-k)\pi),\)
\(j\delta_{jk} = jk.\)

2. Quantization of a System of Non-interacting Spin 1/2 Particles in External Magnetic Fields

A system of \(N\) non-interacting spin 1/2 particles in mutually orthogonal external magnetic fields \(h_x, h_y\) and \(h_z\) is described by the Kronecker sum Hamiltonian

\[ H_F = H_{F_1} \oplus H_{F_2} \oplus \cdots \oplus H_{F_N} \]

where, for \(j, k \in \{0, 1\}\), each single particle Hamiltonian \(H_{F_i}\) at the \(i\)th site, has the matrix elements, in unit of \(\hbar\),

\[ \langle \lambda_i | H_{F_i} | \lambda_k \rangle = -\frac{h_x}{2} \cos j\pi \cos^2 \left( \frac{(j-k)\pi}{2} \right) \]
\[ -\frac{a}{2} \cos \left( j\pi + \frac{h_x}{2} \cos \frac{(k-j)\pi}{2} \right) \sin^2 \left( \frac{(j-k)\pi}{2} \right) \]

with respect to the eigenstates \(\{|\lambda_0\rangle, |\lambda_1\rangle\}\) of the spin 1/2 operator \(S^z_i\), whose elements, in unit of \(\hbar\), are

\[ \langle \lambda_j | S^z_i | \lambda_k \rangle = \frac{\cos j\pi}{2} \cos^2 \left( \frac{(j-k)\pi}{2} \right) \]
\[ = \lambda_j \cos^2 \left( \frac{(j-k)\pi}{2} \right). \]

The remaining two spin 1/2 operators \(S^x_i\) and \(S^y_i\) have matrix elements given by

\[ \langle \lambda_j | S^x_i | \lambda_k \rangle = \frac{1}{2} \sin \left( \frac{(j-k)\pi}{2} \right) \]

and

\[ \langle \lambda_j | S^y_i | \lambda_k \rangle = -\frac{i}{2} \cos j\pi \sin^2 \left( \frac{(j-k)\pi}{2} \right). \]

Parameters \(h_x, h_y\) and \(h_z\) are the external magnetic fields and \(a = h_x - ih_y\).

Explicitly,

\[ H_{F_i} = -h_x S^x_i - h_y S^y_i - h_z S^z_i \]
\[ = -\frac{1}{2} \begin{pmatrix} h_z & h_x - ih_y & -h_z \\ h_x + ih_y & h_z & \end{pmatrix}. \]

2.1. Change of Basis via the Eigenstates of the Single Particle Hamiltonian

Solving the eigenvalue equation \(H_{F_i} |\lambda_j\rangle = \varepsilon_j |\lambda_j\rangle\), the normalized eigenstates \(|\varepsilon_j\rangle\), \(j \in \{0, 1\}\), are found to be

\[ |\varepsilon_j\rangle = a c_j |\lambda_0\rangle + b_j c_j |\lambda_1\rangle, \]

with corresponding eigenvalues

\[ \varepsilon_j = -\hbar / 2 \cos j\pi, \]

where

\[ h = \left( h_x^2 + h_y^2 + h_z^2 \right)^{1/2}, \]
\[ a = h_x - ih_y, \quad b_j = -h \cos j\pi - h_z \]

and

\[ c_j = -\frac{\cos j\pi}{(2\hbar)^{1/2} \left( h + h_z \cos j\pi \right)^{1/2}} \]
\[ \left( h + h_z \cos j\pi \right)^{1/2} = \frac{(h + h_z \cos j\pi)^{1/2}}{(2\hbar)^{1/2} b_j}. \]

Note that

\[ a^* a = -h_0 b_1 = h_x^2 + h_y^2 = h^2 - h_z^2, \]
\[ a^* + a = 2h_x, \quad a^* - a = 2ih_y, \]
\[ b_j b_k = (h + h_z \cos j\pi) \cos^2 \left( \frac{(j-k)\pi}{2} \right) \]
\[ -\left( h^2 - h_z^2 \right) \sin^2 \left( \frac{(j-k)\pi}{2} \right) \]
\[ c_j c_k = \frac{1}{2\hbar} \left( \cos^2 \left( (j-k)\pi / 2 \right) \right) - \frac{\sin^2 \left( (j-k)\pi / 2 \right)}{h^2 - h_z^2} \]
\[ \left( h^2 - h_z^2 \right)^{1/2} \]

and

\[ a^* a \sum_{j=0}^1 c_j^2 = 1, \quad \sum_{j=0}^1 c_j^2 b_j = 0. \]

The diagonalizing matrix \(P\) has elements \(P_{jk} = a c_k \cos^2 ((j-k)\pi / 2) + b_j c_k\), for \(j, k \in \{0, 1\}\). Thus, \(H_{F_i}\) is similar to the diagonal matrix \(D\) having elements

\[ D_{jk} = \varepsilon_j \cos^2 ((j-k)\pi / 2), \]

that is

\[ H_{F_i} = PDP^\dagger, P = \left( \begin{array}{cc} c_0 & c_1 \\ c_0 b_0 & c_1 b_1 \end{array} \right), D = \left( \begin{array}{cc} \varepsilon_0 & 0 \\ 0 & \varepsilon_1 \end{array} \right). \]

With respect to the new basis, \(|\varepsilon_0\rangle, |\varepsilon_1\rangle\), and for \(j, k \in \{0, 1\}\), the Pauli spin matrices have the representation

\[ \langle \varepsilon_j | S^x | \varepsilon_k \rangle = \frac{h_x}{2\hbar} \cos j\pi \cos^2 \left( \frac{(j-k)\pi}{2} \right) \]
\[ + \left( h \cos j\pi + h_z \right) \alpha \sin^2 \left( (j-k)\pi / 2 \right) \frac{1}{4\hbar} \left( h^2 - h_z^2 \right)^{1/2}. \]
\[ \langle \xi_j | S_j^y | \xi_k \rangle = -\frac{\hbar}{2h} \cos j \pi \cos^2 \left( \frac{(j-k)}{2} \right) \]
and
\[ \langle \xi_j | S_j^z | \xi_k \rangle = \frac{\hbar}{2h} \cos j \pi \cos^2 \left( \frac{(j-k)}{2} \right) \]
and
\[ \frac{1}{2h} \sin^2 \left( \frac{(j-k)}{2} \right). \]

2.2. General Basis States for the Matrix Representation of One Dimensional Spin 1/2 Hamiltonian Systems

Since \( H_F \) is a Hermitian operator that lives in a \( 2^N \) dimensional Hilbert space, \( H \) its eigenstates form a complete orthonormal basis, suitable for giving matrix representations for operators living in \( H \) and with the same conditions at the boundary. The eigenvalue equation for \( H_F \) is
\[ H_F | E_r \rangle = E_r | E_r \rangle, \quad r = 0, 1, 2, \ldots, 2^N - 1. \]

For each \( r \) the eigenstate \( | E_r \rangle \) is a direct product of the eigenstates of \( H_{F_i} \) while the eigenvalue is the sum of the respective eigenvalues \( \xi_j \), that is
\[ | E_r \rangle = | \xi_1 \rangle \otimes | \xi_2 \rangle \otimes \cdots \otimes | \xi_N \rangle = \prod_{i=1}^{N} | \xi_i \rangle \]
and
\[ E_r = \xi_1 + \xi_2 + \cdots + \xi_N = \sum_{i=1}^{N} \xi_i, \]
where
\[ \eta = \sin^2 \left( \left\lfloor \frac{r}{2^{N-1}} \right\rfloor \right) \frac{\pi}{2}, \quad i, j = 1, 2, \ldots, N, \]
where \( \lfloor z \rfloor \) is the floor of \( z \), the smallest integer not greater than \( z \). Thus each state \( | E_r \rangle \) is uniquely represented by a binary vector \( r = (\eta_1, \eta_2, \ldots, \eta_N) \).

Thus, any operator \( A \) in \( H \) has the matrix representation \( A \) with elements given by
\[ A_{rs} = \langle E_r | A | E_s \rangle. \]
Using (3) we get
\[ E_r = \hbar \sum_{i=1}^{N} \eta_i - \frac{N \hbar}{2} = \hbar m_r - \frac{N \hbar}{2}. \]

3 Quantization of the One Dimensional Spin 1/2 Ising Model in External Magnetic Fields

Explicit matrix representation

Since \( H_F \) is diagonal in the basis \( \{| E_r \rangle \} \), the only task is to find the matrix elements of \( H_I \) and then add them to those of \( H_F \). We have
\[ H_{I rs} = \langle E_r | H_I | E_s \rangle = -J \sum_{i=1}^{N} \xi_i | S_i^z | E_s \rangle \]
\[ = -J \sum_{i=1}^{N} \delta_{i i+1} S_i^z \delta_{i i+1} + 1, \]
where \( S_i^z = \langle \xi_r | S_i^z | \xi_r \rangle \) and where we have introduced an \( N \) - dimensional vector \( d \) whose components are \( 2^N \times 2^N \) symmetric binary matrices \( d_j \) defined by
\[ d_{rs} = \prod_{j=1}^{N} \delta_{i i+1}. \]

Thus \( d_{rs} = 1 \) if either the two vectors \( r \) and \( s \) are one and the same vector, that is \( r = s \), or they differ only at the consecutive \( i \)th and \((i + 1)\)th entries, otherwise \( d_{rs} = 0 \).

Note that
\[ \delta_{i i+1} \delta_{i i+1} d_{rs} = \delta_{i i+1} c_{rs} = \delta_{rs}, \]
where we have introduced another \( N \) - dimensional vector \( e \) whose components are \( 2^N \times 2^N \) symmetric binary matrices \( c_i \) with elements given by
\[ c_{rs} = \prod_{j=1}^{N} \delta_{i i+1}. \]

Thus \( c_{rs} = 1 \) if either the two vectors \( r \) and \( s \) are one and the same vector, \( r = s \), or they differ only at the \( i \)th component, otherwise \( c_{rs} = 0 \).

Motivated by the definitions in (7), (8) and (9) we introduce two more \( N \) - dimensional vectors, \( a \) and \( b \), whose components are \( 2^N \times 2^N \) symmetric binary matrices, in terms of which the \( c_i \) and \( d_i \) matrices may also be expressed. The \( a_i \) and \( b_i \) matrices are defined through their elements by
\[\alpha_{rs} = \delta_{ri} = \cos^2 \left( \frac{(r_i - s_j)\pi}{2} \right),\]
\[\beta_{rs} = \delta_{ri} \delta_{ri+1} = \alpha_{rs} + \alpha_{r+1s} = \cos^2 \left( \frac{(r_i - s_j)\pi}{2} \right) \cos^2 \left( \frac{(r_i+1 - s_j)\pi}{2} \right).\]

It is straightforward to verify the following properties for the \(\alpha\) and \(\beta\) matrices:

\[\alpha_i \alpha_j = 2^{N-1} \delta_{ij} \alpha_i + 2^{N-2} \left(1 - \delta_{ij}\right)J_{2^N},\]
\[\beta_i \beta_j = \beta_j \beta_i = 2^{N-2} \delta_{ij} \alpha_i \alpha_j + \left(1 - \delta_{ij}\right)J_{2^N} \]

and

\[\alpha_i \beta_j = \beta_j \alpha_i = 2^{N-2} \delta_{ij} \alpha_i \alpha_j + \left(1 - \delta_{ij}\right)J_{2^N},\]

where

\[J_{2^N} = \begin{pmatrix} 1 & 1 & \cdots & 1 \\ 1 & 1 & \cdots & 1 \\ \vdots & \vdots & \ddots & \vdots \\ 1 & 1 & \cdots & 1 \end{pmatrix}\]

is the \(2^N \times 2^N\) all-ones matrix. The \(\alpha\) and \(\beta\) matrices are singular and have trace equal to \(2^N\). The eigenvalues of \(\alpha_i\) are \(2^{N-1}\) repeated twice and \(0\) repeated \(2^N - 2\) times while those of \(\beta\) are \(2^{N-2}\) repeated four times and \(0\) repeated \(2^N - 4\) times. Finally, using multinomial expansion theorem and (10), it is readily established that the matrices \(\alpha = \sum_{i=1}^{N} \alpha_i\) and \(\beta = \sum_{i=1}^{N} \beta_i\) satisfy

\[\alpha^2 = 2^{N-1} \alpha + 2^{N-2} N(N-1)J_{2^N},\]
\[\beta^2 = 2^{N-2} (\alpha + \beta) + 2^{N-4} N(N-3)J_{2^N}\]

and

\[\alpha \beta = 2^{N-1} \alpha + 2^{N-3} N(N-2)J_{2^N}.\]

It is now obvious that

\[c_{rs} = \delta_{rs} + (1 - \alpha_{rs}) \delta_{\alpha_{rs}, N-1}\]
\[= \delta_{rs} + (1 - \alpha_{rs}) \delta_{\beta_{rs}, N-2}\]
\[= \delta_{rs} + \delta_{\beta_{rs}, N-2} \cos^2 \left( \alpha_{rs} \pi / 2 \right),\]
\[d_{rs} = \delta_{rs} + (1 - \alpha_{rs}) \alpha_{r+1s} \delta_{\beta_{rs}, N-2}\]
\[= \delta_{rs} + (1 - \alpha_{rs}) \delta_{\beta_{rs}, N-2}\]
\[= \delta_{rs} + \delta_{\beta_{rs}, N-3} \cos^2 \left( \alpha_{rs} \pi / 2 \right),\]

From (11) and (12) we find

\[c_{rs} = \sum_{i=1}^{N} c_{irs} = N\delta_{rs} + \delta_{\beta_{rs}, N-2}\]

and

\[d_{rs} = \sum_{i=1}^{N} d_{irs} = N\delta_{rs} + 2\delta_{\beta_{rs}, N-2} + \delta_{\beta_{rs}, N-3}.\]

Explicitly

\[c_{rs} = \begin{cases} \cos^2 \left( \alpha_{rs} \pi / 2 \right) & \text{if } \beta_{rs} = N - 2 \\ 0 & \text{if } \beta_{rs} < N - 2, \\ 1 & \text{if } r = s \end{cases}\]

\[d_{rs} = \begin{cases} \cos^2 \left( \alpha_{rs} \pi / 2 \right) \cos^2 \left( \alpha_{r+1s} \pi / 2 \right) & \text{if } \beta_{rs} = N - 3 \\ \sin^2 \left( \alpha_{rs} - \alpha_{r+1s} \pi / 2 \right) & \text{if } \beta_{rs} = N - 2 \\ 0 & \text{if } \beta_{rs} < N - 2 \\ 1 & \text{if } r = s \end{cases}\]

From the definitions of the \(c_i\) and \(d_i\) matrices the following additional properties are evident:

1. \(c^n_i = 2^{n-1} c_i\), \(d^n_i = 4^{n-1} d_i\), for \(n \in \mathbb{Z}^+\).

2. The eigenvalues of \(c_i\) are 0 and 2, each repeated \(2^{N-1}\) times while those of \(d_i\) are 0, repeated \(2^N - 2\) times, and 4, repeated \(2^N - 4\) times.

3. The \(c_i\) and \(d_i\) matrices are singular and have trace \(2^N\).

Returning to (6) and substituting for the matrix elements \(S_{rk}^Z\), we find, after some algebra,

\[H_{rs} = \frac{NJh^2}{4h^2} \delta_{rs} + \frac{b_h^2}{2h^2} \delta_{rs} \sum_{i=1}^{N} \sin^2 \left( (r_i - r_{i+1})\pi / 2 \right) \]
\[- (1 - \delta_{rs}) \left( h^2 - h^2_z \right)^{1/2} \frac{P_{rs} + (1 - \delta_{rs}) J \left( h^2 - h^2_z \right)}{4h^2} Q_{rs},\]

where, (for \(r \neq s\)),

\[P_{rs} = \sum_{i=1}^{N} c_{irs} \cos \left( (r_i - r_{i+1})\pi / 2 \right) = \delta_{\beta_{rs}, N-2} \cos \left( (r_{k-1} + r_{k+1})\pi / 2 \right)\]
and

$$Q_{rs} = \sum_{j=1}^{N} \left( 2c_{rs} - d_{rs} \right) = 2c_{rs} - d_{rs} = -\delta_{rs,N-3},$$

where

$$k = \sum_{j=1}^{N} j(r_j - s_j)^2$$

$$= \sum_{j=1}^{N} \left( 1 - \delta_{rj,sj} \right) = \sum_{j=1}^{N} j \sin^2 \left( \frac{r_j - s_j}{2} \right).$$

Explicitly,

$$P_{rs} = \begin{cases} 1 & \text{if } \beta_{rs} = N-2 \text{ and } r_{k-1} = 0 = r_{k+1} \\ 0 & \text{if } \beta_{rs} < N-2 \text{ or } r_{k-1} + r_{k+1} = 1 \\ -1 & \text{if } r_{k-1} = 1 = r_{k+1} \end{cases}$$

and

$$Q_{rs} = \begin{cases} -1 & \text{if } \beta_{rs} = N-3 \\ 0 & \text{if } \beta_{rs} < N-3 \end{cases}$$

Putting the results together we finally have the matrix elements for the Ising interaction Hamiltonian, $H_I$, to be explicitly given by

$$H_{Irs} = -\frac{NJ_f^2}{4} \delta_{rs} + \frac{Jf^2}{2} \delta_{rs} \sum_{i=1}^{N} \sin^2 \left( \frac{r_i - r_{i+1}}{2} \right)$$

$$- (1-\delta_{rs}) \delta_{rs,N-2} \cos \left( \frac{r_{k-1} + r_{k+1}}{2} \right)$$

$$- (1-\delta_{rs}) \frac{Jg^2}{4} \delta_{rs,N-3},$$

where

$$k = \sum_{j=1}^{N} j \sin^2 \left( \frac{r_j - s_j}{2} \right).$$

4. Example Application: Ground State Energy of Weakly Interacting Spin 1/2 Particles in External Magnetic Fields

When the exchange integral $J$ is small, the Ising interaction term $H_I$ can be treated as a perturbation of $H_F$. In this section, we employ (13) to find corrections, up to the fourth order in $J$, to the energy of the ground state of weakly interacting spin 1/2 particles in mutually orthogonal external magnetic fields. Since the ground state of $H_F$, the unperturbed system, is non-degenerate, we will apply the non-degenerate Rayleigh-Schrödinger perturbation theory.

The following particular cases of (13) will often be useful.

$$H_{I_{ss}} = -\frac{NJ_f^2}{4} + \frac{Jf^2}{2} \sum_{i=1}^{N} \sin^2 \left( s_i - s_{i+1} \right). \quad (15)$$

In particular,

$$H_{I_{00}} = -\frac{NJ_f^2}{4} J. \quad (16)$$

For $s \neq t$

$$H_{I_{st}} = -\frac{Jg^2}{4} \delta_{st,N-2} \cos \left( s_{k-1} + s_{k+1} \right). \quad (17)$$

where
\[ k = \sum_{j=1}^{N} \sin^2 \left( \left( r_j - s_j \right) \frac{\pi}{2} \right). \]

In particular,
\[ H_{I0} = - \frac{fg J}{2} \delta_{\beta_0, N-2} - \frac{g^2 J}{4} \delta_{\beta_0, N-3}. \]  

Note also from (5) that
\[ E_r - E_s = E_{rs} = (m_r - m_s)h, \quad E_{0s} = -m_s h. \]  

4.1. First Order Correction to the Energy

The first order correction to the energy of the ground state of \( F_H \) is the expectation value of the perturbation \( IH \) in the ground state \( \left| E_0 \right\rangle \) of \( F_H \).

Thus, quoting (16), we have
\[ E^{(1)}_0 = \langle H_I \rangle_{E_0} = \langle E_0 | H_I | E_0 \rangle = H_{I00} = -\frac{N f^2 J}{4}. \]  

4.2. Second Order Correction to the Energy

The second order correction to the energy of the ground state of \( F_H \) is given by
\[ E^{(2)}_0 = \sum_{s=1}^{2} \sum_{r=1}^{N} \langle E_0 | H_{I_s} | E_s \rangle \langle E_s | H_I | E_0 \rangle \]
\[ = \sum_{s=1}^{2} |H_{Ios}|^2. \]

According to (18),
\[ H_{Ios} = - \frac{fg J}{2} \delta_{\beta_0, N-2} - \frac{g^2 J}{4} \delta_{\beta_0, N-3}. \]

We therefore see that contributions to \( E^{(2)}_0 \) come only from states with either \( m_s = \sum \eta_1 = 1 \) (corresponding to \( \beta_0 = N - 2 \) ) or \( m_s = \sum \eta_2 = 2 \) (corresponding to \( \beta_0 = N - 3 \) in the case when the two \( \left| \alpha_1 \right\rangle \) states of the direct product state \( |E_s\rangle \) are consecutive). A typical state with \( m_s = 1 \) is the state
\[ |E_{2N-1}\rangle = |\alpha_1\rangle |\epsilon_0\rangle |\epsilon_0\rangle \cdots |\epsilon_0\rangle = (1,0,0,\ldots,0,0) \]
while a particular state with \( m_s = 2 \) (and \( \beta_0 = N - 3 \) ) is the state
\[ |E_{3x2N-2}\rangle = |\alpha_1\rangle |\alpha_1\rangle |\epsilon_0\rangle \cdots |\epsilon_0\rangle = (1,1,0,0,\ldots,0,0). \]

Therefore
\[ H_{I_{0,2N-1}} = - \frac{fg J}{2} \text{ and } H_{I_{0,3x2N-2}} = - \frac{g^2 J}{4}, \]
and since there are \( N \) vectors with \( \beta_0 = N - 2 \) and \( N \) vectors with \( \beta_0 = N - 3 \), using (19), we obtain
\[ E^{(2)}_0 = \frac{N |H_{I_{0,2N-1}}|^2}{\hbar} - \frac{N |H_{I_{0,3x2N-2}}|^2}{2\hbar}. \]

The results (20) and (21) were also obtained in [13].

4.3. Third Order Correction to the Energy

The third order correction to the energy of the ground state of \( H_F \) is obtainable from the formula
\[ E^{(3)}_0 = \sum_{s=1}^{2} \sum_{r=1}^{N} \sum_{t=1}^{N} \langle E_0 | H_{I_s} | E_s \rangle \langle E_s | H_{I_t} | E_t \rangle \]
\[ = \sum_{s=1}^{2} \sum_{r=s+1}^{N} \sum_{t=s+1}^{N} |H_{I_{os}}|^2 |E_{0s}|^2. \]

\[ = S_1 + S_2 + S_3, \]
where
\[ S_1 = \sum_{s=1}^{N} |H_{I_{0s}}|^2 E_{0s}, \]
\[ S_2 = 2 \sum_{s=1}^{N-2} \sum_{t=s+1}^{N} \sum_{r=s+1}^{N} \sum_{t=s+1}^{N} \langle H_{I_{0s}} | H_{I_{1s}} | H_{I_{0t}} \rangle \langle E_{0s} | E_{0t} \rangle, \]
\[ S_3 = -H_{I_{00}} \sum_{s=1}^{N} |H_{I_{0s}}|^2 E_{0s}. \]

Note that in the above derivation we made use of the following summation identity
\[ \sum_{s=1}^{M} \sum_{t=1}^{M} f_{st} = \sum_{s=1}^{M} f_{s} + \sum_{s=1}^{M} f_{s} \]
\[ \sum_{s=1}^{M} \sum_{t=s+1}^{M} f_{st} + \sum_{s=1}^{M-1} \sum_{t=s+1}^{M} f_{st}. \]

**Evaluation of \( S_1 \)**

- Contribution from states with \( m_s = 1 \) (\( \Rightarrow \beta_0 = N - 2 \) )
\[ H_{I_{0s}} = - \frac{fg J}{2}; \quad H_{I_{ss}} = - \frac{f_{-2} J}{4} + f^2 J \] (from)

The contribution of the \( N \) states with \( m_s = 1 \) to the sum \( S_1 \) is therefore
\[ N f^2 J \left( - \frac{f_{-2} J}{4} + f^2 J \right) \hbar^2. \]

- Contribution from states with \( m_s = 2 \) (provided that \( \beta_0 = N - 3 \) )
\[ H_{I_{0s}} = - \frac{fg J}{2} \text{ and } H_{I_{0s}} = - \frac{g^2 J}{4}, \]
\[ H_{fs} = -\frac{g^2 J}{4}, \quad H_{fs} = -\frac{g^2 J}{4} + f^2 J \]

The \( N \) states with \( m_s = 2 \), \( \beta_{0s} = N - 3 \) therefore contribute
\[ N \frac{g^4 J^2}{16} \left( -\frac{Nf^2 J}{4} + f^2 J \right) / (4\hbar^2) \]

to \( S_1 \).

Putting these results together we have
\[ S_1 = \frac{Nf^2 g^2 J^2}{4} \left( -\frac{Nf^2 J}{4} + f^2 J \right) / h^2 \]
\[ + \frac{N \g^4 J^2}{16} \left( -\frac{Nf^2 J}{4} + f^2 J \right) / (4\hbar^2). \]  

**Evaluation of \( S_2 \)**

\[ S_2 = 2 \sum_{s=1}^{2N} \sum_{t=1}^{2N-1} \frac{H_{fs} H_{st}}{E_{0s} E_{0t}}. \]

In each term of the sum, one of four different scenarios is possible, namely, \( m_s = 1 = m_t \) or \( m_s = 2 = m_t \) or \( m_s = 1 \) or \( m_s = 2 \) or \( m_t = 1 \) or \( m_t = 1 \). We look at each possible situation in turn.

- Contribution to \( S_2 \) when \( m_s = 1 = m_t \)

In this case, for each \( s \) vector, there are two possible \( t \) vectors for which the matrix element \( H_{fs} \) does not vanish, as typified below:
\[ \vec{s} : (0,1,0,0,\cdots,0) \quad \vec{s} : (1,0,0,0,\cdots,0) \]
\[ \vec{t} : (1,0,0,0,\cdots,0) \quad \vec{t} : (0,1,0,0,\cdots,0) \]

In such a situation,
\[ H_{fs} = -\frac{g^2 J}{4}. \]

We also have
\[ H_{0s} = -\frac{fgJ}{2} (s \neq 0, \beta_{0s} = N - 2) \]
and
\[ H_{0t} = H_{0t} = -\frac{fgJ}{2} (t \neq 0, \beta_{0t} = N - 2). \]

Since there are \( N \) \( m_s = 1 \) states, the contribution to the sum \( S_2 \) when \( m_s = 1 \) is
\[ \left( 2N \cdot 2 - \frac{fgJ}{2} \cdot 2g^2 J / 4 - \frac{fgJ}{2} / 2 \right) / (-\hbar \cdot 2\hbar) \]
\[ = -\frac{N^2 f^2 g^4 J^3}{8\hbar^2}. \]

- Contribution to \( S_2 \) when \( m_s = 2 \) = \( m_t \)

As in the previous case, for each \( s \) vector, there are only two possible \( t \) vectors for which the matrix element \( H_{fs} \) does not vanish, as typified below:
\[ \vec{s} : (1,1,0,0,\cdots,0) \quad \vec{s} : (1,1,0,0,\cdots,0) \]
\[ \vec{t} : (1,0,1,0,\cdots,0) \quad \vec{t} : (0,1,0,0,\cdots,0) \]

In such a situation,
\[ H_{fs} = -\frac{g^2 J}{4}. \]

From (17) we have
\[ H_{fs} = -\frac{fgJ}{2} \cos(\pi / 2) = 0, \]

signifying a zero contribution to the \( S_2 \) sum.

- Contribution to \( S_2 \) when \( m_s = 1, m_t = 0 \)

Here as in the previous case we have
\[ H_{fs} = -\frac{fgJ}{2} \cos(\pi / 2) = 0, \]

so that again there is zero contribution to the \( S_2 \) sum.

Adding all the contributions we have
\[ S_2 = -\frac{N^2 f^2 g^4 J^3}{8\hbar^2}. \]  

**Evaluation of \( S_3 \)**

\[ S_3 = -H_{0s} \sum_{s=1}^{2N-1} \frac{H_{0s}^2}{E_{0s}^2}. \]

From (16), (18) and (19) we have immediately that
\[ S_3 = \frac{Nf^2 J}{4} \left( \frac{N^2 f^2 g^4 J^2}{4 \hbar^2} + \frac{N \g^4 J^2}{16} / (4\hbar^2) \right). \]

Finally combining (22), (23) and (24), we obtain the third order correction to the energy of the ground state of \( H_F \) as
\[ E_0^{(3)} = \frac{7Nf^2 g^4 J^3}{64\hbar^2} + \frac{N \g^4 J^2}{4 \hbar^2}. \]

**4.4. Fourth Order Correction to the Energy**

The fourth order correction to the energy of the ground state of \( H_F \) is given by the standard Rayleigh-Schrödinger perturbation formula

\[ E_0^{(4)} = \frac{7Nf^2 g^4 J^3}{64\hbar^2} + \frac{N \g^4 J^2}{4 \hbar^2}. \]
Calculations completely analogous to those in the previous sections, but much more involved, give (4) \( E \) as

\[
E^{(4)} = \sum_{s=1}^{2N} \sum_{r=1}^{2N-1} H_{1s} H_{1s} H_{1r} H_{1r} E_0 E_0 E_0 E_0
\]

\[
-2H_{10} \sum_{s=1}^{2N} \sum_{r=1}^{2N-1} H_{1s} H_{1s} H_{1r} E_0 E_0 E_0
\]

\[
-2H_{10} \sum_{s=1}^{2N} \sum_{r=1}^{2N-1} H_{1s} H_{1s} H_{1r} E_0^2 E_0 E_0
\]

\[
+H_{10}^2 \sum_{s=1}^{2N} \sum_{r=1}^{2N-1} H_{1s}^2 E_0^2 E_0 E_0 E_0
\]

or, in a more compact form,

\[
E^{(4)} = \sum_{s=1}^{2N} \sum_{r=1}^{2N-1} H_{1s} H_{1s} H_{1r} H_{1r} E_0 E_0 E_0 E_0.
\]

4.5. Approximate Analytical Expression for the Ground State Energy Per Spin for Weakly Interacting Spin 1/2 Particles in External Magnetic Fields

Adding the energy corrections (20), (21), (25) and (26) to the ground state energy (obtained by setting \( m_r = 0 \) in (5)) of the non-interacting spin 1/2 particles in external magnetic fields we therefore find, to the fourth order in the exchange integral, \( J \), that the energy of the ground state, \( E_{0 IF} \), of the one dimensional Ising model in mutually orthogonal external magnetic fields, for \( N \) spin sites is given by

\[
E_{0 IF} \approx -\frac{Nh}{2} - \frac{Nf^2}{4} J - \frac{Ng^2}{4h} J^2 - \frac{Nf^2 g^2}{12h^2} J^3 + \frac{Ng^4}{64h^2} J^4
\]

\[
-\frac{13Nf^2 g^6}{192h^3} J^4 + \frac{55Nf^4 g^4}{192h^3} J^4
\]

\[
-\frac{Ng^8}{2048h^3} J^4.
\]

that is

\[
E_{0 IF} = \frac{Nf^2 - Ng^2}{2} J - \frac{Nf^2 g^2}{4h} J^2
\]

\[
-\frac{Ng^4}{32h} J^2 + \frac{7Nf^2 g^4}{64h^2} J^3 + \frac{Ng^4}{4h^2} J^3
\]

\[
-\frac{13Nf^2 g^6}{192h^3} J^4 + \frac{55Nf^4 g^4}{192h^3} J^4
\]

\[
-\frac{Ng^8}{2048h^3} J^4.
\]

4.6. Estimation of Various Order Parameters for the Ising Model in Mutually Orthogonal External Magnetic Fields

The knowledge of \( E_0 \) allows the derivation of approximate analytic expressions for physical quantities such as the magnetization in each direction and the spin-spin correlation function for neighbouring spins.
4.6.1. Magnetization

Invoking the Hellmann-Feynman rule in (1) gives for the x-magnetization

\[ m_x = \frac{2}{N} \left( \sum_{i=1}^{N} S_i^x \right) E_{0_{IP}} \]

\[ = -2 \frac{\partial e_0}{\partial h} \]

\[ = -2 \frac{e_0}{h} \frac{\partial e_0}{\partial h} \]

and similar expressions for \( m_y \) and \( m_z \), the y- and z-magnetizations.

According to (27),

\[ e_0 \approx -\frac{h}{2} - \frac{z f^2}{2} \]

\[ -\frac{h}{2} \sum_{m=2}^{4} \left\{ -\frac{m}{2} \sum_{k=0}^{m-1} (-1)^{m-k} \epsilon_k^m \left( g^2 \right)^{k+1} \right\} , \]

so that for \( h \neq 0 \) we obtain

\[ \frac{\partial e_0}{\partial h} \approx -z f^2 \]

\[ + \frac{4}{2} \sum_{m=2}^{4} \left\{ z \frac{m}{2} \sum_{k=0}^{m-1} (-1)^{m-k} \epsilon_k^m \left( g^2 \right)^{k+1} \right\} . \]

Thus for \( h_x < h \neq 0 \),

\[ m_x \approx f \left( -z \frac{f^2}{2} \right) \]

\[ + \frac{4}{2} \sum_{m=2}^{4} \left\{ z \frac{m}{2} \sum_{k=0}^{m-1} (-1)^{m-k} \epsilon_k^m \left( g^2 \right)^{k+1} \right\} , \]

and for \( h_x < h \neq 0 \) and \( h_y < h \neq 0 \), respectively,

\[ m_x \approx \frac{h_x}{h} \left( -z \frac{h_x}{h} \frac{f^2}{2} \right) \]

\[ + \frac{4}{2} \sum_{m=2}^{4} \left\{ z \frac{m}{2} \sum_{k=0}^{m-1} (-1)^{m-k} \epsilon_k^m \left( g^2 \right)^{k+1} \right\} , \]

and

\[ m_y \approx \frac{h_y}{h} \left( -z \frac{h_y}{h} \frac{f^2}{2} \right) \]

\[ + \frac{4}{2} \sum_{m=2}^{4} \left\{ z \frac{m}{2} \sum_{k=0}^{m-1} (-1)^{m-k} \epsilon_k^m \left( g^2 \right)^{k+1} \right\} , \]

Note that in the absence of interaction, \( z = 0, h \neq 0 \),

\[ m_x^2 + m_y^2 + m_z^2 = 1. \]

4.6.2. Nearest Neighbour Spin-spin Correlation

The spin-spin correlation, \( c_{i,i+1} \), is given by

\[ c_{i,i+1} = \frac{2}{N} \left( \sum_{j=1}^{N} S_i^x S_{i+1}^x \right) E_{0_{IP}} \]

\[ = -4 \frac{\partial^2 e_0}{\partial^2 h} \]

\[ = -4 \frac{\partial e_0}{\partial h} \frac{\partial e_0}{\partial h} \]

\[ = -8 \frac{e_0}{h^2} \frac{\partial e_0}{\partial h} \]

yielding

\[ c_{i,i+1} = f^2 + 4 \sum_{m=2}^{4} \left\{ m^2 \sum_{k=0}^{m-1} (-1)^{m-k} \epsilon_k^m \left( g^2 \right)^{k+1} \right\} . \]

Note that in the absence of interaction, \( z = 0 \), we have \( c_{i,i+1} = f^2 \) while \( h = h_z \) gives \( c_{i,i+1} = 1 \).

5. Conclusion

We have given an explicit matrix representation for the Hamiltonian of the Ising model in mutually orthogonal external magnetic fields, with basis the eigenstates of a system of non-interacting spin 1/2 particles in external magnetic fields. We subsequently applied our results to obtain an analytical expression for the ground state energy per spin, to the fourth order in the exchange integral, for the Ising model in perpendicular external fields. Since the Hamiltonian of the non-interacting spin 1/2 particles in external magnetic fields is a Hermitian operator that lives in a \( 2^N \) dimensional Hilbert space, its eigenstates form a complete orthonormal basis, suitable for giving matrix representations for any operator living in the same Hilbert space and with the same conditions at the boundary.
